

SUPERFLOATSTM BY AEROCOMP

Aerocomp Inc

Models Available

SuperFloats™ are available in either “straight” (no wheels) or “amphibious” (retractable wheels) configuration, with your choice of either fully-assembled or kit form. Installation kits containing spreader bars, struts, bracing, brackets, etc. which can be easily adapted to a wide variety of aircraft are also available.

Advantages of SuperFloats™

The Kevlar™-reinforced composite construction of **SuperFloats™** provides pilots with some very unique advantages:

1. No leaking! With no rivets to loosen and leak, and a hull/deck seam that is above the water line, **SuperFloats™** don't require the frequent “pumping out” that is often associated with other floats.
2. **SuperFloats™** are stronger, and more damage-resistant than many other floats. In the rare event that damage is encountered (i.e. beaching in waves on a rocky shore, or striking a solid object at high speed), repairs are simple and easy with commonly available materials.
3. Because **SuperFloats™** utilize modern construction methods and materials, they are both stronger and lighter than comparable floats made of aluminum. This allows pilots to get airborne in less distance (*remember that small fishing lake?*), and with less horsepower needed.
4. **SAFETY** -- in addition to the enhanced performance capabilities, strength and weight savings offered by SuperFloats™, pilots also enjoy the distinct advantages of a “conventional gear” configuration for the retractable gear amphibious models. By opting to replace complex nosewheel systems with simpler, lighter, less complex tailwheels (fully steerable), the risk of upset and capsizing in the event of an inadvertent “wheels-down” landing in water is **SIGNIFICANTLY** reduced. Test flights have been conducted successfully with several different SuperFloats-equipped airplanes that demonstrated **it is possible (although ill-advised) to land in water with the retractable wheels accidentally extended -- without harm!**

Built from easy-to-assemble kits, SUPERFLOATS™ are available in 16 different sizes, and are suitable for use on aircraft as large as 6000 lbs. maximum takeoff weight. SUPERFLOATS™ can be installed on a wide variety of aircraft (non-STC'd, non-certified). Installation kits containing spreader bars, struts, bracing, brackets and hardware are available which can be adapted to fit your application.

Standard Floats

Gross Weight:	SF500	SF800	SF1000	SF1200	SF1400	SF1600	SF1800	SF2000	SF2300	SF2850	SF3150	SF3450
